PATENT  
Filed: February 1, 2002

cent. a1  
sub B1  
cont.  
a transmitter within the remote control unit;  
an actuator coupled to the window covering;  
a receiver within the actuator, the receiver receiving at least one signal from the transmitter;

a wake-up signal amplifier electrically connected to the receiver for receiving a wake-up signal having a first frequency; and  
475 Hz

38 KHz  
a data signal amplifier electrically connected to the receiver for receiving a data signal having a second frequency lower than the first frequency, the data signal carrying information for moving the window covering.

sub B1  
cont.  
A2  
7. (amended) A method for controlling a motorized window covering, comprising the acts of:

deactivating a data signal amplifier;  
activating a wake-up signal amplifier; and  
activating the data signal amplifier to process a data signal to move the window covering only in response to a wake-up signal being received by the wake-up signal amplifier, the wake up signal having a first frequency and the data signal having a second frequency different from the first frequency.

A3  
sub B1  
cont.  
12. (amended) A system for controlling a motorized window covering, comprising:  
an actuator mechanically coupled to an operator of the window covering;

on to

a receiver within the actuator;

a wake-up signal amplifier electrically connected to the receiver for receiving a wake-up signal having a first frequency;

a data signal amplifier electrically connected to the receiver for receiving a data signal having a second frequency lower than the first frequency, the data signal carrying information for moving the window covering; and

a processor within the actuator, the processor including a program for controlling the actuator in response to at least one data signal.
